

## Monday 5 June 2023 – Afternoon

### A Level Further Mathematics A

Y541/01 Pure Core 2

Time allowed: 1 hour 30 minutes

**You must have:**

- the Printed Answer Booklet
- the Formulae Booklet for A Level Further Mathematics A
- a scientific or graphical calculator

#### INSTRUCTIONS

- Use black ink. You can use an HB pencil, but only for graphs and diagrams.
- Write your answer to each question in the space provided in the **Printed Answer Booklet**. If you need extra space use the lined pages at the end of the Printed Answer Booklet. The question numbers must be clearly shown.
- Fill in the boxes on the front of the Printed Answer Booklet.
- Answer **all** the questions.
- Where appropriate, your answer should be supported with working. Marks might be given for using a correct method, even if your answer is wrong.
- Give non-exact numerical answers correct to **3** significant figures unless a different degree of accuracy is specified in the question.
- The acceleration due to gravity is denoted by  $g \text{ m s}^{-2}$ . When a numerical value is needed use  $g = 9.8$  unless a different value is specified in the question.
- Do **not** send this Question Paper for marking. Keep it in the centre or recycle it.

#### INFORMATION

- The total mark for this paper is **75**.
- The marks for each question are shown in brackets [ ].
- This document has **8** pages.

#### ADVICE

- Read each question carefully before you start your answer.

- 1 (a) The matrix  $\mathbf{P}$  is given by  $\mathbf{P} = \begin{pmatrix} 1 & 0 & -2 & 2 \\ 4 & 2 & -2 & 3 \end{pmatrix}$ .
- (i) Write down the dimensions of  $\mathbf{P}$ . [1]
- (ii) Write down the transpose of  $\mathbf{P}$ . [1]
- (b) The matrices  $\mathbf{Q}$ ,  $\mathbf{R}$  and  $\mathbf{S}$  are given by  $\mathbf{Q} = \begin{pmatrix} 1 & 2 \end{pmatrix}$ ,  $\mathbf{R} = \begin{pmatrix} 3 & -4 \\ 2 & 3 \end{pmatrix}$  and  $\mathbf{S} = \begin{pmatrix} 3 & -2 \end{pmatrix}$ .
- Write down the sum of the two of these matrices which are conformable for addition. [1]
- (c) The dimensions of matrix  $\mathbf{A}$  are 4 by 5. The matrices  $\mathbf{A}$  and  $\mathbf{B}$  are conformable for multiplication so that the matrix  $\mathbf{C} = \mathbf{BA}$  can be formed. The matrix  $\mathbf{C}$  has 6 rows.
- (i) Write down the number of columns that  $\mathbf{C}$  has. [1]
- (ii) Write down the dimensions of  $\mathbf{B}$ . [1]
- (iii) Explain whether the matrix  $\mathbf{AB}$  can be formed. [1]
- (d) Find the value of  $c$  for which  $\begin{pmatrix} -2 & 3 \\ 6 & 10 \end{pmatrix} \begin{pmatrix} c & 5 \\ 10 & 13 \end{pmatrix} = \begin{pmatrix} c & 5 \\ 10 & 13 \end{pmatrix} \begin{pmatrix} -2 & 3 \\ 6 & 10 \end{pmatrix}$ . [2]

2 In this question you must show detailed reasoning.

- (a) Write the complex number  $-24 + 7i$  in modulus-argument form. [3]
- (b) Solve the simultaneous equations given below, giving your answers in cartesian form.
- $$\begin{aligned} iz + 3w &= -7i \\ -6z + 5iw &= 3 + 13i \end{aligned}$$
- [4]

- 3 (a) Show that  $\frac{d}{du}(\sinh^{-1}u) = \frac{1}{\sqrt{u^2 + 1}}$ . [2]
- (b) Find the equation of the normal to the graph of  $y = \sinh^{-1} 2x$  at the point where  $x = \sqrt{6}$ . Give your answer in the form  $y = mx + c$  where  $m$  and  $c$  are given in exact, non-hyperbolic form. [4]

**4 In this question you must show detailed reasoning.**

The region  $R$  is bounded by the curve with equation  $y = \frac{1}{\sqrt{3x^2 - 3x + 1}}$ , the  $x$ -axis and the lines with equations  $x = \frac{1}{2}$  and  $x = 1$  (see diagram). The units of the axes are cm.

A pendant is to be made out of a precious metal. The shape of the pendant is modelled as the shape formed when  $R$  is rotated by  $2\pi$  radians about the  $x$ -axis.

Find the exact value of the volume of precious metal required to make the pendant, according to the model. [4]

**5 In this question you must show detailed reasoning.**

(a) Using the definitions of  $\sinh x$  and  $\cosh x$  in terms of exponentials, show that  $\sinh 2x \equiv 2 \sinh x \cosh x$ . [2]

(b) Solve the equation  $15 \sinh x + 16 \cosh x - 6 \sinh 2x = 20$ , giving all your answers in logarithmic form. [5]

6 The equation of the plane  $\Pi$  is  $\mathbf{r} = \begin{pmatrix} -1 \\ 2 \\ 1 \end{pmatrix} + \lambda \begin{pmatrix} 4 \\ 4 \\ 3 \end{pmatrix} + \mu \begin{pmatrix} -2 \\ 3 \\ 1 \end{pmatrix}$ .

(a) Find the acute angle between  $\Pi$  and the plane with equation  $\mathbf{r} \cdot \begin{pmatrix} 2 \\ 0 \\ 3 \end{pmatrix} = 4$ . [4]

The point  $A$  has coordinates  $(9, -7, 20)$ .

The point  $F$  is the point of intersection between  $\Pi$  and the perpendicular from  $A$  to  $\Pi$ .

(b) Determine the coordinates of  $F$ . [4]

7 In this question you must show detailed reasoning.

(a) Show that

$$\sum_{r=1}^n \frac{5r+6}{r^3+r^2} = \frac{a}{n+1} + b + c \sum_{r=1}^n \frac{1}{r^2}$$

where  $a$ ,  $b$  and  $c$  are integers whose values are to be determined. [6]

You are given that  $\sum_{r=1}^{\infty} \frac{1}{r^2}$  exists and is equal to  $\frac{1}{6}\pi^2$ .

(b) Show that  $\sum_{r=1}^{\infty} \frac{5r+6}{r^3+r^2}$  exists and is equal to  $(\pi-1)(\pi+1)$ . [2]

- 8 A surge in the current,  $I$  units, through an electrical component at a time,  $t$  seconds, is to be modelled. The surge starts when  $t = 0$  and there is initially no current through the component. When the current has surged for 1 second it is measured as being 5 units. While the surge is occurring,  $I$  is modelled by the following differential equation.

$$(2t - t^2) \frac{dI}{dt} = (2t - t^2)^{\frac{3}{2}} - 2(t - 1)I$$

- (a) By using an integrating factor show that, according to the model, while the surge is occurring,  $I$  is given by  $I = (2t - t^2)(\sin^{-1}(t - 1) + 5)$ . [6]

The surge lasts until there is again no current through the component.

- (b) Determine the length of time that the surge lasts according to the model. [2]
- (c) Determine, according to the model, the rate of increase of the current at the start of the surge. Give your answer in an exact form. [3]

- 9 A function is defined by  $y = f(t)$  where  $f(t) = \ln(1 + at)$  and  $a$  is a constant.

- (a) By considering  $\frac{dy}{dt}$ ,  $\frac{d^2y}{dt^2}$ ,  $\frac{d^3y}{dt^3}$  and  $\frac{d^4y}{dt^4}$ , make a conjecture for a general formula for  $\frac{d^ny}{dt^n}$  in terms of  $n$  and  $a$  for any integer  $n \geq 1$ . [3]
- (b) Use induction to prove the formula conjectured in part (a). [4]
- (c) In the case where  $f(t) = \ln(1 + 2t)$ , find the rate at which the 6<sup>th</sup> derivative of  $f(t)$  is varying when  $t = \frac{3}{2}$ . [2]

**10 In this question you must show detailed reasoning.**

A region,  $R$ , of the floor of an art gallery is to be painted for the purposes of an art installation. A suitable polar coordinate system is set up on the floor of the gallery with units in metres and radians.  $R$  is modelled as being the region enclosed by two curves,  $C_1$  and  $C_2$ . The polar equations of  $C_1$  and  $C_2$  are

$$C_1 : r = 5, \quad -\frac{1}{2}\pi \leq \theta \leq \frac{1}{2}\pi$$

$$C_2 : r = 3 \cosh \theta, \quad -\frac{1}{2}\pi \leq \theta \leq \frac{1}{2}\pi$$

Both curves are shown in the diagram, with  $R$  indicated.

The gallery must buy tins of paint to paint  $R$ . Each tin of paint can cover an area of  $0.5 \text{ m}^2$ .

Determine the smallest number of tins of paint that the gallery must buy in order to be able to paint  $R$  completely.
