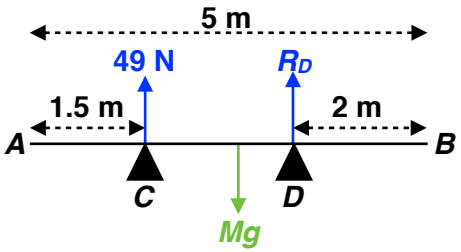
Non-uniform rods, tilting and moment of angled force

Starter

1. **(Review of last lesson)**
A uniform rod, AB, of length 5 m and mass M kg, rests horizontally in equilibrium on supports at C and D, as shown. If the magnitude of the normal reaction at C is 49 N, find:
(a) the magnitude of the normal reaction at D,
(b) the mass, M, of the rod.



Working: (a) An unknown force acts through the centre of the rod so take moments about the centre.

↻ about centre: $R_D \times 0.5 = 49 \times 1$

$R_D = 98$ N

The normal reaction at D is 98 N

(b) $R(\uparrow)$: $R_D + 49 = Mg$

$98 + 49 = Mg$

$M = 15$ kg

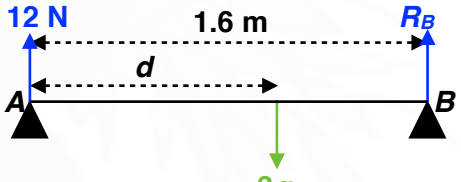
The mass, M, of the rod is 15 kg

E.g. 1 A non-uniform beam, AB, of mass 3 kg and length 1.6 m rests horizontally in equilibrium on vertical supports at A and B. The normal reaction at A is 12 N. Find
(a) the magnitude of the normal reaction at B
(b) the distance of the centre of mass of the beam from A.

Working: (a) $R(\uparrow)$: $R_B + 12 = 3g$

$R_B = 3g - 12$

$R_B = 17.4$ N



The magnitude of the normal reaction at B is 17.4 N.

(b) In case our answer to R_B is wrong, take moments about B.

↻ about B: $3g \times (1.6 - d) = 12 \times 1.6$

$4.8g - 3dg = 19.2$

$4.8g - 19.2 = 3dg$

$$d = \frac{4.8g - 19.2}{3g}$$

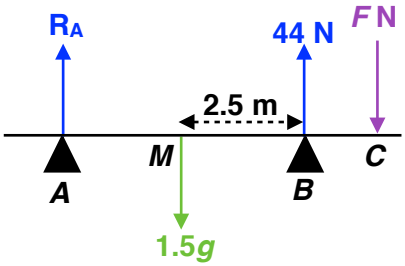
$$d = \frac{232}{245} = 0.947 \text{ m (3 s.f.)}$$

The distance of the centre of mass of the beam from A is 0.947 m

E.g. 2 A non-uniform rod of mass 1.5 kg rests horizontally in equilibrium on supports at A and B, as shown. When a downwards force of magnitude F N is applied to the rod at C, the rod remains horizontal and in equilibrium, but is on the point of tilting about B, where the normal reaction has magnitude 44 N. Given that the distance between B and the centre of mass is 2.5 m, find:

(a) the value of F,

(b) the distance between the points B and C.



Working:

(a) The rod is on the point of tilting about B so the normal reaction at A is zero i.e. $R_A = 0$

$R(\uparrow)$: $F + 1.5g = 44$

$F = 44 - 1.5g$

$F = 29.3$ N

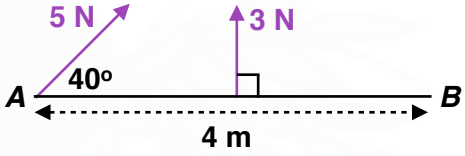
(b) Let d be the distance between B and C

$\circlearrowleft$ about B: $29.3 \times d = 1.5g \times 2.5$

$$d = \frac{735}{586} \approx 1.25$$

The distance between the points B and C is 1.25 m (3 s.f.)

E.g. 3 A light rod, AB, has length 4 m. A force of magnitude 5 N is applied to A at an angle of 40^o above the rod, as shown. A second force of magnitude 3 N is applied vertically upwards at the rod's midpoint. Find the sum of the moments of the forces acting on the rod about B.



Working:

Resolve the 5 N force perpendicular to the rod: $5 \sin 40$

$\circlearrowleft$ about B: $5 \sin 40 \times 4 + 3 \times 2 \approx 18.9$

The sum of the moments about B is 18.9 Nm (3 s.f.) clockwise.
