### Activities

- 14.1 Chirping Crickets
  - 14.2 Shoe Size
  - 14.3 Temperature Conversion
  - 14.4 Mozart
- Notes and Solutions (3 pages)

## ACTIVITY 14.1

## Chirping Crickets

In forests in many warm and humid parts of the world, crickets can be heard making chirping sounds. The rate at which they chirp varies according to the temperature; the warmer it is, the more quickly they chirp (maybe because they are happy!).

A suggested formula that connects the temperature in degrees Fahrenheit,  $y$ , and the number of chirps made in one minute,  $x$ , is

$$y = \frac{1}{4}x + 40$$

- What is the temperature when the number of chirps per minute is
  - 60
  - 80
  - 100 ?
- Using axes  $0 \leq x \leq 120$ ,  $0 \leq y \leq 100$ , plot the graph of the function
 
$$y = \frac{1}{4}x + 40$$
- Use your graph to predict
  - the temperature when there are 71 chirps per minute,
  - the number of chirps per minute when the temperature is  $67^\circ\text{F}$ .

### Extension

What is the relationship between the temperature in degrees Celsius and the number of chirps per minute?

## ACTIVITY 14.2

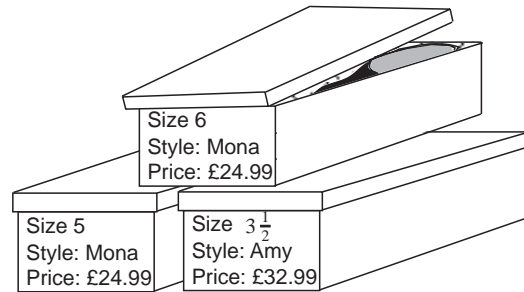

## Shoe Size

Correct shoe size is important; your feet need room for growth until they are full-size, but not so much room that the shoes will become sloppy and provide inadequate support.

For adults, there is a simple relationship between the length of the foot,  $x$  inches, and the adult shoe size,  $y$ . This is given by

$$y = 3x - 25$$

(Note that if  $y$  is not a whole number, then you must take the next whole number *larger* than the value.)

- Use the formula to determine the suitable shoe size when
  - $x = 9$  inches
  - $x = 11$  inches
  - $x = 11\frac{1}{2}$  inches.
- With axes  $0 \leq x \leq 15$  and  $0 \leq y \leq 20$ , draw the graph of  $y = 3x - 25$ .
- Use the graph to estimate the required shoe size when
  - $x = 9\frac{1}{2}$  inches
  - $x = 10$  inches
  - $x = 10\frac{1}{2}$  inches.
- Design a ready reckoner that summarises the range of foot lengths suitable for each adult shoe size from 2 to 13.

### Extension

- Repeat questions 1 and 3, using half-sizes as well as whole number sizes.
- Find out about the relationship between the European Shoe Size (Paris Points) and UK sizes.

## ACTIVITY 14.3

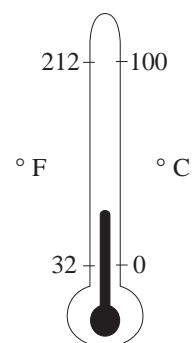

## Temperature Conversion

There are two scales for measuring temperatures in common use in the UK:

degrees Fahrenheit ( $^{\circ}\text{F}$ ), devised by a German physicist,  
*G D Fahrenheit* (1686–1736),

and

degrees Celsius ( $^{\circ}\text{C}$ ), devised by a Swedish astronomer,  
*Anders Celsius* (1701–1744).

The second of these scales was originally known as the 'centigrade' scale, as it uses the  $0^{\circ}$  -  $100^{\circ}$  range to correspond to the Fahrenheit scale's  $32^{\circ}$  (the temperature at which pure water freezes) to  $212^{\circ}$  (the temperature at which it boils). Temperatures do, of course, exist outside these ranges: for example, temperatures at the polar caps (North and South Poles) *never exceed*  $0^{\circ}\text{C}$ , while the temperature inside a blast furnace is about  $1000^{\circ}\text{C}$ . Although the Celsius scale is now used for most purposes, you will find that the Fahrenheit scale is still also in common usage.

- On coordinate axes, with  $^{\circ}\text{C}$  as the  $x$ -axis ( $0^{\circ} \leq C^{\circ} \leq 100^{\circ}$ ) and  $^{\circ}\text{F}$  as the  $y$ -axis ( $0^{\circ} \leq F^{\circ} \leq 220^{\circ}$ ), plot the two points  $(0, 32)$  and  $(100, 212)$ . Draw the line that passes through these two points.
- What is the gradient of this line?
- What is the intercept of the  $y$ -axis?
- What is the formula for  $F$  in terms of  $C$ ?
- Use your graph to estimate the following temperatures in  $^{\circ}\text{F}$ :  
(a)  $20^{\circ}\text{C}$                       (b)  $25^{\circ}\text{C}$                       (c)  $52^{\circ}\text{C}$   
Check your answers using the formula.
- Use your graph to estimate the following temperatures in  $^{\circ}\text{C}$ :  
(a)  $59^{\circ}\text{F}$                       (b)  $75^{\circ}\text{F}$                       (c)  $98.4^{\circ}\text{F}$
- Rewrite the formula in the form  $^{\circ}\text{C} = \dots\dots\dots$

### Extension

An approximate formula for converting between  $^{\circ}\text{C}$  and  $^{\circ}\text{F}$  is given by

$$F = 2C + 24$$

By drawing this graph on the set of axes used for question 1, estimate when it is a reasonable approximation to use. At which point does the approximation become exact?

# ACTIVITY 14.4

## Mozart

Wolfgang Amadeus Mozart was born in Salzburg, Austria, on 27 January 1756 and died in Vienna on 5 December 1791. He is one of the best known composers in the history of western music.

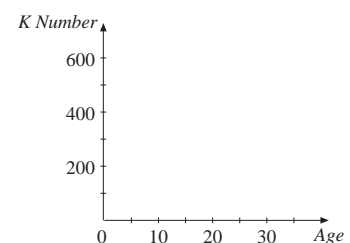

He was a child prodigy and composed a large number of works, using every type of musical composition, and travelling to many countries to perform.

His works were numbered chronologically by a biologist, *Ludwig Ritter von Köchel*, whose catalogue was published in 1862. The following table lists some of Mozart's compositions, each denoted by a 'K' (Köchel) number.

<i>K number</i>	<i>Date Completed</i>	<i>Age (Years)</i>	<i>Title</i>
1	January 1762	6	Minuet
33	June 1766	10	Kyrie
65	January 1769		Dance Music
123	April 1770		Contredanse
176	December 1773		Dance Music
192	June 1774		Missa Brevis (Mass)
238	January 1776		Piano Concerto No. 6
271	January 1777		Piano Concerto No. 9
317	March 1779		Missa (Mass)
385	July 1782		Symphony No. 35 (Haffner)
425	November 1783		Symphony No. 36 (Linz)
470	April 1785		Andante for Strings
525	August 1787		Serenade (Eine Kleine Nachtmusik)
551	August 1788		Symphony No. 41 (Jupiter)
588	January 1790		Opera (Cosi fan tutte)
620	September 1791		Opera (Die Zauberflöte - The Magic Flute)
626	December 1791		Requiem

- Copy and complete the 'Age' column.
- Plot the data of age ( $x$ -axis) against K number ( $y$ -axis), and by eye, draw a line of best fit.
- Use the graph to estimate Mozart's age when he completed the piano concertos: (a) K453, (b) K491.
- Estimate how many compositions he had completed by the time he was 30 years old.
- Estimate the K number for his quartet which was finished on Christmas Day, 1777.
- Find the equation of your line in question 2, in the form  $y = mx + c$ , i.e.  $K = m \times \text{age} + c$ . Use the equation to answer question 3 and 5 again. Does it give accurate answers?
